Pigeons: how to tax capital gains (1/2)

By Guillaume Allègre and Xavier Timbeau

After having proposed in the <u>2013 Budget Bill</u> to tax gains from the sale of securities at the progressive scale used by France's income tax, and no longer at a proportional rate of 19%, the government has now promised to correct its work under the pressure of a group of entrepreneurs who rallied on the social networks under the hashtag #geonpi ("pigeons", using French verlan slang, which inverts syllables). An <u>amendment to</u> <u>the Bill</u> was passed to this effect. Here we discuss the equitable taxation of capital gains on securities. In a second post, we will discuss the specificity of entrepreneurship.

The Budget Bill reflects François Hollande's commitment to enact a major tax reform to make the contribution of each fairer: "capital income will be taxed just like work income" (Commitment 14 of the 60 commitments for France). When the capital results from the saving of employment income that was paid at a "normal" rate, taxing it poses the problem of double taxation and may seem questionable. Note, however, that in a financialized economy income from capital is not simply the result of saving, but also the direct result of an activity (see issue 122 of the special revue de l'OFCE issue on tax reform, and in particular Allègre, Plane and Timbeau on "Réformer la fiscalité du patrimoine? "Reforming wealth taxation"). In this sense, capital income derives from households' ability to pay, just as does labour income. The progressive tax on income must apply to all income, whether it comes from capital or labour, in order to respect the principle of horizontal equity, *i.e.* "on equal income, equal tax".

With respect to gains on disposal, only the change in the real

value of the capital can be considered as income: if the value of a good has increased at the same rate as inflation, the nominal gain, even if positive, does not cover the implicit cost of ownership. The Bill provided that gains on disposals are entitled to an allowance based on the length of holding, which was copied from that applicable to real estate gains. The amendment reduces the durations of holding relative to the original text:

– the capital gains taxable at the income tax rate are reduced by an allowance equal to:

a) 20% of their value when the shares, units, rights or securities have been held for at least two years and less than four years at the date of sale;

b) 30% of their value when the stocks, units, rights or securities have been held for at least four years and less than six years at the date of sale;

c) 40% of their value when the stocks, units, rights or securities have been held for at least six years.

This type of allowance on the nominal capital gain is a poor instrument for taking account of inflation: if the variation of the real value of the capital is zero, then the tax should be zero (there is no real income), whereas an allowance will only reduce it; and on the contrary, if the change in the real value of the capital is much higher than inflation, then the allowance will be too favourable; the allowance is a fixed amount based on increments, while price rises are a continuous phenomenon. At least the allowance does not reach 100%, which is still the case for most real estate capital gains, which are totally exempt from gains on property that has been held 30 years. A good system would not apply an allowance to the nominal gain, but would actualize the purchase price using an index that reflects prices, which would make it possible to determine changes in the real value of the asset. **Examples**: a good is purchased in January 2000 for 100. It is re-sold for 200 in January 2011. The nominal gain is 100. The allowance of 40% applies, and hence, in the system proposed by the government, the taxation would be on 60, and incorporated in the income tax. The variation in the real value of the capital is 79, which is the most reasonable basis for the taxation (we are not interested here in the rate of taxation, but the taxable base).

If, however, in January 2011 the property were re-sold for 120, the amount used by the allowance system would be 8, whereas the variation in the real value of the capital would be -1.

The following table shows the tax base according to the allowance system and the change in the real value of the capital (in parentheses) based on the re-sale value and on the date of acquisition for a good acquired for a value of 100 and re-sold in 2012.

Year of purchase	1990	1995	2000	2005	2010	2012
Re-sale value						
110	6 (-36)	6 (-22)	6 (-14)	6 (-2)	8 (6)	10 (10)
150	30 (4)	30 (18)	30 (26)	30 (38)	40 (46)	50 (50)
200	60 (54)	60 (68)	60 (76)	60 (88)	80 (96)	100 (100)
250	90 (104)	90 (118)	90 (126)	90 (138)	120 (146)	150 (150)

Note on interpretation: For a good purchased at 100 in 1990 and resold at 110 in 2012, the tax base after deduction of 40% is 6 while the change in the real value of the capital is -36, given inflation. While the economic income is negative (there is a loss of purchasing power), with the allowance system the tax base increases. For a good purchased at 100 in 2005 and resold at 250 in 2012, the tax base after deduction is 90, while the change in the real value of the capital is 138: the allowance system is very favourable when the gain is large.

The tax base should be the capital gain after taking into account the inflation tax (variation in the real value of the capital). But this tax base should not be directly subject to

a progressive tax scale. Gains on disposals are in fact deferred and should be subject to a charge equivalent to that on a regular income throughout the ownership period. Smoothing with a quotient that varies with the holding period deals with this point. This kind of system divides the income by the number of years held [1], applying the progressive scale to this "regular income equivalent", while adding the household's other income for the current year, then multiplying the increase in the tax related to the exceptional income by the number of years held [2]. An alternative is to tax the capital gains upon disposal at a constant rate equal to the principal marginal rate (30%, to which should be added the CSG wealth tax).

The following points need to be added to the comments above:

- General clearing systems between gains and losses over a long period (currently10 years) make it possible to take into account risks and potential losses, at least for diversified investors;
- As income from employment can easily be converted into capital income (through various financial instruments and portage arrangements), aligning the two taxes could limit the temptations of tax optimization, which opens the door to tax avoidance;
- In this respect, an Exit Tax, based on the unrealized capital gains, could be used to minimize the interest of becoming a tax exile, which increases with accumulated gains and tax potential.

Donations, especially when they are made outside inheritance, should not be used to erase capital gains, as is currently the case. This provision, which was initially intended to avoid double taxation, can now be used to completely escape taxation. [1] Based on the equivalence of tax treatment for a regular income and an exceptional income, it appears that the division is made using a coefficient that depends on the interest rate. In practice, for low interest rates, this coefficient is equal to the number of years of ownership.

[2] This calculation is equivalent to regular taxation over time if the household's current earnings are representative of its income (assuming regular income) for the duration of ownership and if the tax schedule is relatively stable.

Taxes on wealth: what kind of reform?

By Guillaume Allègre, Mathieu Plane and Xavier Timbeau

Why and how should wealth be taxed? Are France's wealth taxes fair and efficient? In an article entitled, "<u>Reforming the taxation of wealth?</u>", published in the <u>special Tax Reform</u> issue of the *Revue de l'OFCE* [in French], we examine these issues and propose some possible ways to reform the taxation of wealth.

We show that in recent years real economic income from capital has been very substantial. The visible income from capital (interest, dividend, rents received, etc.) exists alongside less visible income (capital gains net of the consumption of fixed capital and inflationary tax). As only a portion of potential capital gains are realized, this less visible income forms a significant part of average personal income. Between 1998 and 2010, despite two financial crises, capital gains increased real per capita income by an annual average of 12% (33% on average from 2004 to 2007). This growth was due in large part to the sharp rise in property prices.

We also show that the actual tax rate on income from wealth is low, even though the nominal interest rates on capital income are high, and the tax rate on income that is actually taxed is even higher due to not taking into account inflationary tax in the calculation of taxes [1]. After taking into account all taxation based on household wealth, including wealth which is held ("ISF" wealth tax, property tax) or which is passed on (property transaction taxes *i.e.* "stamp duty") and income from wealth (income tax, "CSG" wealth tax, etc.), the actual rate of taxation on economic income from capital [2] comes to an average of 11.1%. This low rate for the actual taxation of capital income is due to the fact that a large portion of this income fully or partially escapes taxation: real property gains on principal residences are totally exempt, and secondary residences are partly exempt; the housing enjoyed by owner-occupiers ("imputed rent") is not taxable, even though, net of interest, it constitutes income; gifts serve to "purge" any capital gains, even when these are not taxed (there is a tax allowance of 159,000 euros per child for gifts to direct heirs, which is renewable every ten years); and some financial income avoids income tax (life insurance, tax-exempt bank accounts, etc.).

Next we discuss possibilities for reform that would lead to taxing all income from wealth. We believe that income from wealth (net increased income from wealth) should be taxed in the same way as labour income. This principle is fair (in the sense that households are then taxed on their contributory capacity, regardless of the source of their income), and it would also help to combat tax avoidance. In an increasingly financialized economy, the interface between labour income and capital income has become porous. Taxing capital income differently opens the door to tax schemes. Any reform of wealth taxation should make it a priority to tax all real capital gains, in particular real property gains, which currently are subject to specific rules. In addition, since property is a fixed asset, the existing rules cannot be justified as due to tax competition in Europe. They are occasionally defended based on the need to take account of inflation or due to the unique character of the principal residence. But taking inflation into account cannot justify the total exemption of real property gains on secondary residences after they have been held for a certain time (currently 30 years, previously 22 years): not only does the exemption on capital gains seem unfair, but it can also prompt some households to keep their property, in particular during speculative bubbles. Furthermore, the specific character of property cannot be invoked once there has been a definitive withdrawal from the market. The taxation of realized capital gains, net of inflation, of the consumption of fixed capital and of renovation costs, would thus be preferable to a system of allowances based on the period of ownership. This could take place when the sale is not followed by another purchase so as not to penalize mobility - and during inheritance (taxation of unrealized gains, before calculating inheritance tax). The taxation of real property gains upon a definitive withdrawal from the market could gradually replace the system of property transaction taxes or "stamp duty", which would promote mobility and greater horizontal fairness.

In light of these arguments, what do we make of the proposals by the new French President François Hollande with regard to the taxation of wealth? He proposes (1) to tax capital income at the same rate as labour income is taxed; (2) to roll back the tax breaks on the ISF wealth tax and to raise the rate of taxation on the top income brackets; and (3) to reduce the inheritance tax allowance from 159,000 euros per child to 100,000 euros (it was raised from 50,000 euros to 150,000 euros in 2007).

(1) The first point would also involve eliminating the flatrate withholding tax and the various tax loopholes that permit tax avoidance. It is similar to our proposals, so long as the income subject to tax takes into account inflationary tax and the consumption of fixed capital. This kind of proposal would involve taxing imputed rent, which constitutes an imputed income from capital. Nevertheless, given the difficulty of estimating the tax base, imputed rent has not been taxed since 1965 (see the article by Briant and Jacquot). One solution to this difficulty is to permit renters and first-time buyers to deduct their rent or loan interest payments from their taxable income, while increasing the average income tax rate to offset this.

(2) The second point departs from our proposals, but the ISF tax offers one solution for taxing large estates bit by bit, even when they do not procure any taxable income (when there are unrealized capital gains but an absence of dividends or earned rent, for example). In a situation like this, the ISF tax makes sense only if it is not capped based on the taxable income (or a similar notion). The ISF tax on wealth makes even more sense when the actual yields, including the unrealized gains on the assets, are not very heterogeneous (but it is then equivalent to a tax on the income from the assets) or when the supervision of the asset owners can improve their yields (taxation based on holding the wealth, and not on income, then serves as an additional incentive "to owners to 'activate' their estate," in the words of Maurice Allais). In contrast, if the asset yields are heterogeneous and strong incentives to optimize the wealth already exist, then a tax on the income from the wealth is preferable from the viewpoint of fairness and not undermining economic efficiency.

(3) Higher inheritance taxes seem legitimate from the perspective of equal opportunity. We feel, however, that this

should go further, at least by eliminating the purge of capital gains, in particular when the goods have been exempted from inheritance tax.

* This text is taken from the article <u>Reforming the taxation</u> <u>of wealth?</u> published in the special Tax Reform issue of the <u>Revue de l'OFCE</u>, available on the <u>OFCE website</u>.

[1] As <u>Henri Sterdyniak</u> points out: "It is thus erroneous to claim that capital income is taxed at a lower rate. When it is *actually* taxed, this is at higher rates."

[2] Defined as the ratio between the sum of taxes based on wealth and the net increased income from the wealth after having subtracted the consumption of fixed capital and inflationary tax.
