Should the Eurozone rely on the US?

by <u>Christophe Blot</u>, Caroline Bozou and <u>Jérôme</u> Creel

The Covid-19 pandemic has led governments and

central banks around the world to implement expansionary fiscal and monetary

policies. The United States stands out for its substantial fiscal support,

which is much greater than that in the euro area. In a recent paper prepared

for the <u>Monetary Dialogue between the European Parliament</u> and the <u>European Central Bank</u>,

we review these measures and discuss their international implications. Given

the size of the US stimulus packages and the weight of its economy, we can

indeed expect significant spillover effects on the euro area. However, the

impact will depend not only on the orientation of economic policy but also on

the precise nature of the measures adopted (transfers, spending and the $\,$

articulation between monetary and fiscal policy).

Expansionary monetary policy is generally perceived as a policy based on self-interest, since a fall in the US interest rate should

lead to a depreciation of the US dollar that is unfavourable to America's trading

partners. However, the literature shows that the exchange rate

channel can be

dominated by a financial channel and by increased demand from the US economy,

both of which generate positive spillovers (see <u>Degasperi</u>, <u>Hong and Ricco</u>, <u>2021</u>).

The international spillover from US fiscal policy should also be positive, once again *via* demand effects, and also due to an expected appreciation of the dollar (see Ferrara, Metelli, Natoli and Siena, 2020) as well as from expectations of a return to

balanced public finances à la Corsetti,

Meier and Müller (2010).

The favourable impact on the rest of the world might also be attenuated if the

US fiscal expansion were to lead to a rise in the global interest rate. Ultimately, the magnitude of the international spillover effects of US fiscal policy will depend on the response of the

exchange rate and the interest rate. <u>Faccini</u>, <u>Mumtaz and Surico (2016)</u> confirm the importance of financial effects but nevertheless

show that the real interest rate could fall after a US expansionary shock.

In this paper, simulations conducted using a macroeconomic model and empirical analysis confirm the positive effects of US expansionary

monetary policy on euro area GDP. There is, however, uncertainty about the

timing and duration of these positive effects.

As regards fiscal policy, empirical analysis

suggests that the spillover from the US measures implemented since the outbreak

of the Covid-19 crisis will be positive, at least in the short term (in the

first two years). Given the size of the fiscal impulse, the

impact would not be
negligible.

The global spillover from US macroeconomic policies is therefore expected to be positive, but there is some uncertainty beyond 2022.

However, it should be borne in mind that the euro area's growth will depend primarily on the path taken by its own policy mix. The euro area should not therefore rely only on

US policy to consolidate and accelerate its recovery. The contrasting fiscal

impulses in 2020 and 2021 between the US and the euro area already indicate a

risk of increasing divergence between the two regions.

We also briefly discuss that the main repercussions from the US may come

not from macroeconomic policies but from financial risks. Asset prices have

risen sharply in 2020, sparking fears of a financial bubble, at least in the

US. This risk could have a significant impact on the euro area in the medium to long term.
