

AAA, AA+: much Ado About nothing?

by [Jérôme Creel](#)

The loss of France's AAA rating on Friday the 13th of January 2012 was a historic event. It poses three questions: should the austerity measures announced in autumn 2011 be strengthened? Why has Germany been singled out? And what is to be done now?

The loss of the AAA rating on French government bonds is not surprising – far from it. The sovereign debt crisis that has shaken the euro zone for over two years, starting in the autumn of 2009, was not managed properly because it occurred during a recession, at a time when all the EU Member States had their eyes glued to their own economic difficulties. In the absence of a concerted response that included immediate solidarity and mutual guarantees by the euro zone Member States of the zone's entire public debt, with the support of the European Central Bank (cf. Catherine Mathieu and Henri Sterdyniak, [here](#)), the foreseeable contagion occurred. The objective public finance mistakes committed by successive Greek governments followed by the vagaries of the Irish banks have now led to a systemic crisis in Europe.

By implementing austerity measures simultaneously, Europe's governments have magnified the economic difficulties: economic stagnation and even recession are now on the agenda for the euro zone (cf. Xavier Timbeau *et al.*, [here](#)). A downgrade of debt ratings in the euro zone was thus to be expected. It does, however, raise three questions.

1. Should the austerity measures be strengthened? In a commentary on the supplementary 7 billion euro French austerity plan announced in November 2011, Mathieu Plane

(see in French [here](#)) pointed out that the race for the AAA rating had already been lost. The impact of this austerity plan on economic growth was objectively inconsistent with the fiscal consolidation target – and Standard & Poor's was surely not unaware of this argument.

2. Why did S&P single out Germany and Slovakia, the only economies in the euro zone not downgraded on Friday 13 January? While their commercial links are undeniable (cf. Sandrine Levasseur, 2010, [here](#)), which could justify their comparable treatment, the main markets for both of these economies, and particularly Germany, lie in the euro zone. Slowing growth in the euro zone outside Germany will not leave the other side of the Rhine unaffected (cf. Sabine Le Bayon, in French [here](#)). It is difficult to see how the contagion of the crisis could stop at the borders of Germany and Slovakia. The recent take-up of German government 6-month bonds at a negative interest rate could even be interpreted to reflect extreme distrust of Germany's commercial banks. In any case, its economy, situated in the euro zone, is no less fragile than that of France.
3. What should be done now in France? The loss of the AAA rating reflects a negative outlook both for the state of public finances and for economic growth. While Germany has not been downgraded, it is possible that this is because S&P takes a positive view of its non-cooperative strategy in the past. From this perspective, the principle of a social VAT measure can be considered a way to help France catch up with Germany in terms of competitiveness, as Jacques Le Cacheux points out ([here](#)): if the Germans did it, why can't we? This would help boost tax revenue by increasing the competitive advantage of businesses established in France. If such a measure were to be adopted, Germany and France would be on equal footing. The two countries could then sensibly consider a cooperative policy for a recovery in Europe.

Some possible focuses include: industrial policy (cf. Sarah Guillou and Lionel Nesta, in French [here](#)); social policy; an ambitious climate and energy policy (cf. Eloi Laurent, [here](#)); and a financial policy that includes a common tax on financial transactions, with the revenue raised being used to ensure that the taxpayer would never again need to bail out the private banks, which would free up additional maneuvering room for the first three policies. The policy outlines would of course need to be defined, but it is crucial to recognize that policy action is urgently needed.

Why the developed countries should renounce their AAA rating

By [Catherine Mathieu](#) and [Henri Sterdyniak](#)

By their very nature, states with monetary sovereignty should renounce their AAA rating: indeed, what is the logic behind having the rating agencies rate a state whose default is rendered impossible by its ability to create its own money? To avoid dependence on the rating agencies and put an end to the crisis in Europe, the Member States of the euro zone must recover their monetary sovereignty through the joint, virtually complete guarantee of their public debts.

Since 1945, no developed country has defaulted on its debt. There was no risk on the debt, since the states borrowed in their own currency and could always obtain financing from their central bank. The developed countries enjoyed “monetary sovereignty”. This is still the case today for Japan (which

enjoys 10-year loans at 1% despite a debt of 210% of GDP), the United States (which borrows at 2% with a debt of 98% of GDP), and the United Kingdom (which borrows at 2.5% with a debt of 86% of GDP).

Banks and insurance companies cannot function if they do not have risk-free assets and if they have to guard against the failure of their own state, which is of course impossible: the amounts involved are enormous, and government securities serve to guarantee banking and insurance activities. The banks and insurance companies could not accumulate enough capital to withstand the bankruptcy of their own country or multiple euro zone countries. As we can see today with the sovereign debt crisis in the euro zone, such a requirement would lead to the general paralysis of the banking system.

It is fundamentally absurd that the rating agencies rate a state with monetary sovereignty, as if its default were an option worth considering. States with monetary sovereignty should renounce their AAA rating: by their nature, their debt is risk-free because it is guaranteed by the central bank's power to create money.

The euro zone countries have lost their "monetary sovereignty": under the Treaty of the European Union, the European Central Bank has no right to finance Member States, and the States are not bound by joint liability. The financial markets noticed this in mid-2009, and suddenly uncontrollable speculation erupted, targeting the most fragile countries in the zone: first Greece, Portugal, and Ireland, which had the fastest growth before the crisis, but will have to change their growth pattern, and then, like dominos, Italy, Spain, and even Belgium. Today, Belgium has to pay an interest rate of 3.8%, Spain 5.2% and Italy 5.6%, compared with 2.6% in France and just 1.8 % for Germany. Greece, Ireland, and Portugal are now in the situation that the developing countries faced yesteryear: their debts have become risky assets subject to high risk premiums, and they are being

brought under the yoke of the IMF.

The workings of the financial markets could completely paralyze fiscal policy. When a country enjoys monetary sovereignty, then in a recession the central bank can lower its maximum interest rate and if necessary commit to keeping it low in the long term; the state increases its deficit, but the low interest rates prevent the debt from snowballing; and it pushes exchange rates lower, which boosts activity. Since the debt is guaranteed by the creation of money, there is no risk of bankruptcy, and thus no reason to have to constantly *reassure* the markets. The central bank, by maintaining long-term rates at low levels in a recession, ensures that fiscal policy is effective. Fiscal policy does not need to worry about the markets. This is still the strategy of the United States today.

In the euro zone, the risk is that in the future a country could no longer increase its deficit for fear that the agencies might downgrade its rating and interest rates would then soar. The countries are therefore condemned to prove their virtue so as to appear as wise as Germany in the eyes of the markets. This renders their fiscal policy impotent, and their economic situation spins out of control (see, for example, [The impossible programme of the candidates for the presidential election](#)). The public debt becomes a permanent risk factor, since the states are at the mercy of the markets' insatiable appetite. Any economic policy should of course be assessed while taking into account the views of the markets. Yet the markets have no special competence in macroeconomics. They impose austerity policies during a recession and then turn around and complain about the lack of growth – which is exactly what they are doing today with respect to the euro zone in general, and Italy and Greece in particular. They are promoting free market reforms such as cutting social welfare programs or the number of teachers. For countries to retain the ability to regulate their economic activity, the risk of

default needs to be zero.

The euro zone must thus choose between dissolution and a reform that would guarantee the public debt of the Member States, which would re-gain their “monetary sovereignty”. European public debts should become risk-free assets, compensated at low rates but guaranteed in full (by European solidarity and fundamentally by the ECB). This is the only way to maintain the independence of fiscal policy, which is essential given the disparities in Europe and the loss by each country of its monetary and exchange rate instruments.

The functioning of the euro zone was not thought through at the time of its creation, particularly with respect to the trade-off between “autonomy of fiscal policy / single currency / monetary sovereignty”. Joint liability creates a moral hazard problem, as each country can increase its debt without limit, but a lack of a guarantee leaves the field open to the play of the financial markets, which are constantly on the lookout. The guarantee cannot be limited to countries that meet the automatic rules, which is unwarranted economically and fails to comply with the Stability Pact. It should be automatic and total. To avoid moral hazard, the European Treaty should include a provision for the extreme situation where a country carries out an unsustainable fiscal policy, in which case the new debt of the country would no longer be guaranteed – but this should never come to pass.

Freed of the need to reassure the markets, the euro zone countries could engage in differentiated but coordinated fiscal policies, with their main objective being to ensure a return to a satisfactory level of employment consistent with low inflation.
